

Project Almanac Guidelines

▲ 04/01 UPDATE: Solution Requirements Updated

We have updated the submission standards. **You are now required to provide a detailed, step-by-step solution, including each link you directly access to find the GTFA.**

You must explicitly reference the link of every source that is **STRICTLY** required to solve the prompt. Prerequisite knowledge does not need to be cited in the solution, only references that directly contain information used to solve the prompt.

Welcome to Project Almanac!

The goal of this project is to improve the model's ability to research and track information across a long context window. You will create STEM prompts that result in a single, verifiable Ground Truth Final Answer (GTFA). Your prompts must require a multi-step search process; your solution must not be found on a single page, but must instead follow a chain of information across several different online sources to reach the final result.

Think of your prompts as a domain specific **Scavenger Hunt**. Each intermediate step must be successfully completed to "unlock" the final answer.

A good task will test the model in the following areas:

1. Web-Browsing: Improving real-time information retrieval.
2. Long-Context Reasoning: Enhancing the ability to process large amounts of data.
3. Chain of Research: Maintaining context through multiple intermediate steps.

The task has the following main components:

- **Prompt** – **VERY IMPORTANT**
- **Model stump & model failure explanations**
- **Solution steps**
- **Correct verifiable answer** (1 - 2 words)

- [Sources](#)

Change Log

Date	Change
Apr 6, 2026	Prompt now needs one valid model fail vs two previously

Prompt

The success of this **task is largely defined by the quality of the prompt**. The prompts need to:

- ☐ **be browsing-heavy**, think of the prompt like a **complicated trivia question** that requires extensive searching to solve
- ☐ **ensure objectivity**, the prompt cannot be subjective; it must lead to a factual, unbiased result
- ☐ require **multi-hop causal chain in browsing** (search requests in the task should be causally chained from each other – [see examples below](#))
- ☐ be **complex** enough to stump 1 frontier models
- ☐ cover **long-context information over 30+ browsing sites**
- ☐ be **well-defined** such that there is **unique verifiable short answer** (or defined set of answers)
- ☐ be **timeless, or include specific time intervals** (cannot reference "today" or "now")
- ☐ **end** with an explicit **"final ask"** command (e.g. "Report only [X]", "I only want you to output [XYZ]"). **Your final ask MUST be related to your domain.**

Extensive Browsing Definition: Search requests trigger the model to browse websites for finding information. If the model answers from its pretraining knowledge, it does not qualify as search.

Multi-hop Causal Chain Definition: Search requests are continuation of each other instead of being independent. (e.g. Find the Italian region with the highest education index and report the number of schools for the smallest city in that state.)

TIP: Try to use language which chains and links the requests instead of explicitly stating what you want the model to search.

Well-defined Definition: The prompt needs to include appropriate constraints such that no matter who takes on solving it, they arrive at the same verifiable answer (or a set of answers).

TIP: Engineer your prompt in such a way that the beginning of the prompt covers all the long-context searching and the last part seeks for a very specific outcome.

Timelessness Definition: The prompt is written in such a way that if you were to answer in 10 years, the answer would still be the same. For example, "Who is the president of the US now?" is NOT a timeless question. But "Who is the president of the US as of Mar 2026" is a timeless question.

TIP: Add year/dates to make the prompt timeless wherever applicable.

Additional Requirements

Demand High Domain Specificity

Your final request must require specialized expertise rather than surface-level metadata. For example, simply identifying an author or their country of origin is insufficient. The prompt must necessitate domain-specific technical knowledge, with every intermediate step logically advancing toward the final goal. Avoid "forced" or contrived logic; each transition must feel essential to the core task.

Maintain a Natural Narrative Flow

Avoid presenting a rigid list of explicit constraints. Instead, the prompt should read like a continuous, cohesive thought process. Integrate requirements by referencing earlier context or findings naturally (e.g., "Given the properties established above...") to build context organically.

Craft a Clear Final Request

The final instruction should be a polished, complete sentence that ties previous checkpoints together. Avoid mechanical labels like "Final Request: [Task]." Instead, ensure the objective is a natural culmination of the preceding narrative, explicitly referencing previous steps without breaking the conversational tone.

Domain-Specific & Math Calculations

Tasks requiring specialized calculations must involve a causal chain of research.

Multistep Browsing is Mandatory: Your task cannot be a simple "extract one value and calculate." You must visit intermediary sources to build toward the solution.

Example of an Insufficient Task: "Find the average distance of all planets and Earth on April 1, 2025, in km." (This does not require enough complex web-browsing).

Prompt Writing Recommendations:

1. **Find a broad initial context:** results from a conference, recently published papers, a unit from a difficult class, etc.
2. **Expand upon the initial context:** related subtopics, properties, events, discoveries
3. **Add constraints to filter your results:** additional research criteria
4. **Pinpoint a GTFA:** form a final request of your prompt. Ensure verifiability
5. **Test the models & iterate**

Your prompts SHOULD look like a sequential expansion and research process:

For the post-Soviet countries where the education index as of Mar 2026 was above 0.75 check out the excavation findings from the 20 year span of 2006 to 2026 and just report the age of the oldest site.

Each website visited, even if it does not yield the final answer, counts as a source.

"Check out the excavation findings from the 20 year span"

"just report the age of the oldest site."

Russia	"The site of Kermek was discovered by V.E. Shchelinsky in 2008, and through a combination of geological, biostratigraphic, and paleomagnetic data, it is dated to the Early Pleistocene, approximately 2.1 million years ago"
Belarus	"The Stone Age (Lower-Early Middle Paleolithic) site in the village of Ogovo (Ivanovo District, Brest Oblast) is considered to be the oldest one in the Belarusian lands"
Moldova	"In 2010, Oldowan flint tools were discovered at Dubasari on the lower Dniester that are 800,000–1.2 million years old"
Estonia	"Pulli was settled around 11,000 years ago"
Latvia	"The oldest known settlement is Salaspils Laukskola, which was created some 11,000 years ago"
Lithuania	"Hamburgian culture sites in southern Lithuania, dating to roughly 13,000–12,000 years ago"
Georgia	"Archaeological and geologic evidence pushes back Dmanisi's first occupations to shortly after 1.85 million years ago"
Armenia	"The oldest dated sites come from the Lori Plateau in northern Armenia (near the Georgian border)"
Kazakhstan	"The Silkady Tanirkazgan site is one of the oldest archaeological sites in Southern Kazakhstan, dating back to the Lower Paleolithic era"
Kyrgyzstan	"Sel-Ungur is a Lower Paleolithic site located in the Alai mountain region of Kyrgyzstan and is one of the most significant finds of Paleolithic Central Asia"

Bulk of the research: Find excavation findings found from 2006–2026, identify the oldest site

Your Prompts should NOT look like a single one dimensional chain of queries:

In the example below, each instruction in the prompt only corresponds to one possible search and answer. The search space never increases, and there are rarely multiple valid candidates for each subquery.

A 2017 Cell Chemical Biology review from Yale looked at targeted protein degradation, specifically PROTACs. One molecule in particular was worth noting, and unlike most BET-targeting degraders at that time, it took out one BET bromodomain family member and largely left the other two alone. The same year, a group published the crystal structure of this PROTAC caught in the act, bound to both its target and its recruited E3 ligase at once. It was the first ternary complex crystal structure ever solved for a PROTAC, and the review cited the PDB accession code directly. What is the PDB entry of this structure?

Model Stumps

A "Model Stump" occurs only when the model provides an incorrect Ground Truth Final Answer (GTFA), regardless of their internal reasoning.

Strict Requirement: Model fails are strictly conditional on an incorrect GTFA.

Once an incorrect GTFA is established, failures usually stem from:

1. Failure to Parse: Inability to correctly extract data from a source.
2. Failure to Reason: Inability to connect the logical dots between data points.

Submitting a task without BOTH model stumps will result in loss of permissions for this project.

For each model response, you will write **1-2 sentences** identifying where exactly the model failed. This can be due to information retrieval or reasoning.

For this project, a model is only considered stumped if it returns an **incorrect GTFA**.

- **Logical Equivalence:** A model is NOT stumped if its answer differs only in format or notation from the GTFA. If the answer is logically equivalent (e.g., \$0.5\$ vs \$1/2\$, or "12 PM" vs "Noon") it is correct, despite the specificity of the prompt.

- **Reasoning:** If the model arrives at the correct answer, even if its reasoning is completely wrong, we consider the model correct and this will NOT count as a stump.

Quantitative Prompts

- **Continuous or Calculated Values:** For answers involving measurements, physics calculations, or non-integers, the model is stumped if the answer deviates by $> 5\%$ from the GTFA. (This margin accounts for rounding differences).
- **Discrete Counts & Combinatorics:** For questions requiring an exact count (e.g., "How many ways can you arrange..." or "Count the number of..."), the answer must match the GTFA exactly. The 5% tolerance does not apply to discrete quantities.

Qualitative Prompts

- **Precise Terms:** The model is stumped only if the term is logically inequivalent to the GTFA.
- **Formatting:** Differences in capitalization, spacing, or punctuation (e.g., dashes) do not count as a stump.

Solution Steps

When writing your solution, **please state each intermediate answer AND the source where you found relevant information.** Please do not submit a solution that simply restates the prompt instructions, without the results of each subquery.

TIP: Plan out the sequence of steps in which the browsing task can be broken down into smaller chunks and solve them.

Example Prompt:

For the post-Soviet countries where the education index as of Mar 2026 was above 0.75 check out the excavation findings from the 20 years span of 2006 to 2026 and just report the age of the oldest site.

Good Solution	Bad Solution
<u>Step 1:</u> Determine the post-Soviet countries. Russia Ukraine ... Belarus	<u>Step 1:</u> Determine the post-Soviet countries. <u>Step 2:</u> Check the countries for which the education index is above 0.75, using the UNDP Education Index data for 2023.

Source: https://en.wikipedia.org/wiki/Post-Soviet_states Step 2: Check the countries for which the education index is above 0.75. Based on the UNDP Education Index data (2023 values, the most recent available), here are the post-Soviet countries with an education index above 0.75: Lithuania — 0.91 Latvia — 0.91 Estonia — 0.90 Source: https://worldpopulationreview.com/country-rankings/education-index-by-country Continued...	Step 3: Search for the notable archaeological excavations across the post-Soviet countries that have uncovered the oldest finds. Continued...
---	--

Ground Truth Final Answer (GTFA)

A successful task must have a single **verifiable Ground Truth Final Answer (GTFA)**. We are building a dataset that models will learn from, and thus we must differentiate between rewarding good model behavior or adjusting bad behavior. Therefore, GTFAs must be easily verifiable for a correct or incorrect answer.

When two experts answer a well constructed prompt, their GTFAs should be an exact string-match.

The GTFA must be a numerical, symbolic answer, or short technical word/phrase.

Examples of Good GTFAs: "Berlin", "3", "Plato, Socrates", "MiaSolé, Mascoma"

It is extremely important that:

1. No reasonable expert can come up with a correct answer that is different from your answer. Your prompt must have one singular indisputable GTFA.
2. The single correct answer can be verified by another expert (i.e. not overly complex).

A verifiable prompt has the following properties:

- **Must be unambiguous** – Prompt is good if 100 experts will always agree on the correct GTFA given the same prompt.
- **Must be self-contained** – All assumptions necessary to solve the problem must be explicitly stated.
- **Must be highly specific** – the format of the GTFA should not be ambiguous. For quantitative prompts, units and precision should be included. For qualitative prompts, naming conventions or standards should be stated.

Here are some common mistakes to avoid. Your answer is likely non-verifiable if it:

- **Is Subjective** – Different people may answer differently, and all could be valid.
- **Requires a Proof or a Long Explanation** – The response is open-ended or unnecessarily verbose/complex. These prompts encourage long-form responses that can vary a lot in structure, tone, or explanation—even when technically correct. This makes it hard to tell if the answer truly matches the GTFA or not.
- **Is Abstract or Philosophical** – It involves interpretation rather than facts. Any answer is technically “valid,” which breaks our ability to judge correctness.
- **Is a Multipart Question** – Multi-part prompts increase the chance of partial or misaligned answers, which makes them harder to judge against a single GTFA.
- **Includes "No Solution" Answers** – We want to avoid cases where the answer is simply "No Solution" or unknown/ undefined.
- **Uses Yes/No or True/False Questions** – Binary answers or multiple choice answers are easily guessable by the model.
- **Provides an Open-ended Range Instead of a Definite Value** – Answers should not be open-ended numerical ranges (e.g., \$a\$ is all real numbers").

Sources

You MUST cite links to at least 30+ relevant sources used to find your GTFA.

- Any source that you visit in your solution
- Each page within a particular domain would count as a unique source
- Your sources should be in English
- Sources that aggregate or synthesize knowledge
- Intermediary sources that redirect you to key information
- Sources that provide prerequisite knowledge necessary to find the GTFA (must be above high school level)

You should NOT be able to solve the problem with very few sources.

- If a prompt asks about a Biology research paper and all the prerequisite knowledge is included in the *Background* and *Methods* sections of the paper, **your other sources become redundant** and this task would not be valid.

Number your sources:

1. https://en.wikipedia.org/wiki/Leonhard_Euler
2. https://en.wikipedia.org/wiki/Graph_theory
- ...
30. <https://link.springer.com/article/10.1140/epjb/e2004-00301-0>

Common Errors

✗ Subjective Prompts: A prompt fails if it is not **"well-defined."** Avoid using opinion-based words; your prompt must be engineered so that **any person following your steps arrives at the exact same conclusion.**

✗ Incorrect Verifiable Answer: The "Verifiable Answer" must be a direct, single answer or short set. It should be limited to **only 1 or 2 words** and must **not include** thinking steps or extra descriptions.

✗ Model Failure Stumping and Explanation: A model failure **is only valid if the model fails to retrieve the correct, single verifiable answer**, your explanation should be based on information retrieval. Do not cite formatting issues, such as the use of paragraphs or bullet points, as a reason for a "stump."

✗ Minimal Retrieval: "As of 2025, who is the wealthiest former board of director of Paypal?". **Requires research, but not a sufficient causal chain**

✗ Unrealistic or Contrived Prompts: "Find all vice presidents who were a secretary before taking office. Of these individuals select the one who served after the year 2000 and find the 4th letter of his Vice-Presidential predecessor's oldest child's undergraduate alma mater." **Non-consequential information, unrealistic prompt.**

Additional Clarifications

Please review these updates thoroughly before proceeding with your next task.

Note on Throttling: If you find yourself throttled, please refer to the [CB Journey chart](#) for more information on task limits.

Tool Use Constraints

Your problems should only require web search. Do not create tasks that require:

- Code compilation or algorithm writing.
- Differential equation modeling.

- Histological/Lab result analysis.
- Chemical experimentation.

Source Standards & Constraints

While we require 30+ sources, they do not all need to be interdependent (30 conditional steps). However, they must follow a "staged" dependency:

Each stage of sources must depend on the previous stage.

Permissible types:

- Aggregated info (Wikipedia), original primary sources, detailed data (specific papers/companies), and prerequisite background info (above high school level).

We HIGHLY recommend organizing your citations into these "stages" in accordance with your solution, for your own reference, and the reviewers ease. The first source should be where you start your search, and the final source should have the GTFA.

Reliability & Accessibility

- **Verifiability:** A third party must be able to find the correct GTFA and all intermediary steps using only your prompt and the internet.
- **Paywalls:** These are acceptable, but you must explicitly write the information you extracted in your solution so reviewers can verify it.
- **Web PDFs:** Must be English, predominantly text-based, and machine-readable (copy-pasteable).

Dev Tools Pop-up

You may see a "Dev Tools" warning during your workflow. For this project, you can ignore this message. Copy-pasting links into the sources section is highly encouraged.

Golden Examples

The following examples are Generalist prompts. They demonstrate the core essence of the task. Your goal will be to create prompts that **require domain expertise** that hold a similar structure to the golden examples.

Example #1	
Prompt	For the post-Soviet countries where the education index as of Mar 2026 was above 0.75 check out the excavation findings from the 20 years span of 2006 to 2026 and just report the age of the oldest site.
Verifiable Answer	Approximately 2,100,000 years
Solution Steps	Step 1: Determine the post-Soviet countries. - Russia - Ukraine - Belarus - Moldova - Estonia - Latvia - Lithuania - Georgia - Armenia - Azerbaijan - Kazakhstan - Kyrgyzstan - Tajikistan - Turkmenistan - Uzbekistan Step 2: Check the countries for which the education index is above 0.75. Based on the UNDP Education Index data (2023 values, the most recent available), here are the post-Soviet countries with an education index above 0.75: - Lithuania — 0.91 - Latvia — 0.91 - Estonia — 0.90 - Georgia — 0.89 - Kazakhstan — 0.81 - Moldova — 0.80 - Belarus — 0.79 - Russia — 0.78

Armenia — 0.78

Kyrgyzstan — 0.76

The five that fall at or below 0.75 are Ukraine (0.74), Uzbekistan (0.74), Turkmenistan (0.74), Azerbaijan (0.73), and Tajikistan (0.68).

Step 3: Search for the notable archaeological excavations across the post-Soviet countries that have uncovered the oldest finds.

Lithuania - the oldest archaeological evidence in Lithuania comes from the Hamburgian culture sites in southern Lithuania, dating to roughly 13,000–12,000 years ago

Latvia - The oldest known settlement is Salaspils Laukskola, which was created some 11,000 years ago — comparatively shortly after the retreat of the glacier. Ambermarks

Estonia - Pulli was settled around 11,000 years ago, at the beginning of the 9th millennium BC. Wikipedia

Georgia - Archaeological and geologic evidence pushes back Dmanisi's first occupations to shortly after 1.85 million years ago, documenting repeated use of the site over the period 1.85–1.78 million years ago. PNAS The hominin fossils themselves are dated to approximately 1.77–1.8 million years ago.

Kazakhstan - The Silkadv Tanirkazgan site is one of the oldest archaeological sites in Southern Kazakhstan, dating back to the Lower Paleolithic era. Located in the Karatau Mountains of the Zhambyl region, it was first discovered by archaeologist H.A. Alpysbayev in 1958 and revisited in 2000.

Moldova - In 2010, Oldowan flint tools were discovered at Dubasari on the lower Dniester that are 800,000–1.2 million years old, demonstrating that early humans were present in Moldova during the early Paleolithic. Wikipedia

Belarus - The Stone Age (Lower-Early Middle Paleolithic) site in the village of Ogovo (Ivanovo District, Brest Oblast) is considered to be the oldest one in the Belarusian lands and one of the oldest in Eastern Europe. Belarus Recent excavations have led researchers to conclude that the first humans appeared in what is now Belarus approximately 400,000 years ago.

Russia - The site of Kermek was discovered by V.E. Shchelinsky in 2008, and through a combination of geological, biostratigraphic, and paleomagnetic data, it is dated to the Early Pleistocene, between approximately 2.1 million years ago. ScienceDirect

Armenia - The Armenian Highlands have been settled by human groups from the Lower Paleolithic to modern days. The first human traces are supported by the presence of Acheulean tools, generally close to the obsidian outcrops, more than 1 million years ago. Wikipedia The oldest dated sites come from the Lori Plateau in northern Armenia (near the Georgian border). At the Karakhach site, zircon crystallization ages of 1.942 ± 0.046 Ma, 1.804 ± 0.030 Ma, and 1.750 ± 0.020 Ma date the enclosed Early Acheulian lithic artifacts ScienceDirect — making the Karakhach site nearly 2 million years old, roughly contemporaneous with Dmanisi in neighboring Georgia. A 2-million-year-old site was also reported near Stepanavan. Armenia is additionally famous for its Areni-1 Cave, where a 6,100-year-old winery and a 5,500-year-old leather shoe were discovered.

Kyrgyzstan - Sel-Ungur is a Lower Paleolithic site located in the Alai mountain region of Kyrgyzstan and is one of the most significant finds of Paleolithic Central

	Asia. Vassar College Originally discovered in 1955 and formally excavated beginning in 1980, the cave yielded 1,500 stone tools and 4,000 mammal bone fragments. Step 4: Apply the constraint of time being from 2006 March until 2026 March. Kermek was discovered by V.E. Shchelinsky in 2008 - 2.1M years ago Step 5: Report the years Approximately 2.1M years ago

Model Failure	Model A Responded 1.8m years looking at <i>Homo erectus</i> tooth and jawbone found at Orozmani. Model B

	Responded ~1.85 million years old — the Dmanisi hominin remains from Georgia.
--	---

Example #2	
Prompt	Find the startup that won the green tech innovation award at CES 2026. Then, look up who their venture capital backers are and list other companies in the same sector in those VCs' portfolios that received overlapped backing from them as of CES 2026 date
Verifiable Answer	{ MiaSolé, Mascoma }
Solution Steps	Step 1: The startup that won CES 2026 Innovation award in sustainability and energy transition: Amprius Technologies Step 2: The venture capitalists that backed Amprius Technologies: Venture Capital Firms: Kleiner Perkins Caufield & Byers, Trident Capital, VantagePoint Capital Partners, IPV Capital, SAIF Partners, and Chinergy Capital EquityZenFinSMEs were among the core VC investors. Bossanova also participated in VC rounds. Step 3: Other greentech startups in Kleiner Perkins Caufield & Byers portfolio Batteries & Energy Storage: Amprius Technologies, QuantumScape, Bloom Energy, Aquion Energy, Primus Power, A123 Systems (co-invested), GMZ Energy Solar: MiaSolé, Ausra (acquired by AREVA), Solixel / BeamReach Solar, Amonix, Alta Devices Electric Vehicles & Transportation: Fisker Automotive, Proterra, V-Vehicle, Think (Norwegian EV) Biofuels & Agriculture: Amyris Biotechnologies, Mascoma, Altra Biofuels, EdenIQ, Agrivida Wind Energy: UpWind Solutions (acquired by Vestas), FloDesign Wind Turbine Smart Grid / Energy Software / Efficiency: Silver Spring Networks, Opower (acquired by Oracle for \$552M), Clean Power Finance, Enlighted, SClenergy, Enphase Energy, Transphorm Smart Home & Consumer: Nest (acquired by Google for \$3.2B), RecycleBank, Soladigm / View (smart glass) Geothermal: AltaRock Energy Industrial & Other Cleantech: GreatPoint Energy (coal-to-gas), Lehigh Technologies (rubber recycling), CalStar Products, Lilliputian Systems (micro fuel cells), TAS Energy, Enerkem, Glori Energy, SinoEV Technologies, Beyond Meat, Kotak Urja

Current / Recent Sustainability Portfolio: Watershed (carbon footprint software, ~\$1.8B valuation as of 2024)

Step 4: Other greentech startups in Trident Capital's portfolio - no noteworthy VC investments in greentech

Step 5: Other greentech startups in VantagePoint Capital Partners' portfolio

Electric Vehicles & Transportation:

Tesla Motors — the most famous investment; early backer

Better Place — EV battery-swapping infrastructure (failed)

Solar:

MiaSolé — thin-film solar panel maker (also a Kleiner Perkins investment)

BrightSource Energy — concentrated solar thermal power

SolarCentury — UK-based solar installer and developer

Recurrent Energy — solar project developer

LED Lighting:

Bridgelux — LED chip and lighting technology

SuperBulbs — energy-efficient lighting

Biofuels & Biochemicals:

Solazyme (now TerVia) — algae-based biofuels and biochemicals

Cobalt Biofuels — biobutanol production

Mascoma — cellulosic ethanol from biomass

Chemrec AB — Swedish black liquor gasification for biofuels

Energy Storage:

Premium Power Corporation — zinc-bromine flow battery energy storage

Amprion Technologies — silicon anode lithium-ion batteries

Energy Efficiency & Smart Grid:

Tendril Networks — home energy management software

AlertMe — smart home energy monitoring (UK-based)

Aura Technologies — wireless lighting controls for commercial buildings

iWatt — energy-efficient power management semiconductors

Serious Materials (later Serious Energy) — energy-efficient building materials

Fuel Cells:

Angstrom Power — micro fuel cells for portable electronics

Water & Waste:

Ostara Nutrient Recovery Technologies — wastewater nutrient recovery, producing commercial fertilizer

Ze-Gen — waste-to-energy gasification

Data Centers / Green Infrastructure:

Switch — large-scale green data center operations

Other Energy / Power:

Senergen — energy technology

New Energy Capital — clean energy project finance (achieved exit via M&A/IPO)

Step 6: Other greentech startups in IPV Capital portfolio

Amprion Technologies — silicon anode lithium-ion batteries (NYSE: AMPX)

RayVio Corp — UV LED technology for water disinfection, surface and air purification. IPV Capital co-led a \$26M round alongside Tsing Capital.

Step 7: Other greentech startups SAIF Partners

	Batteries & Advanced Energy: Amprius Technologies — silicon anode lithium-ion batteries (NYSE: AMPX); SAIF led the Series C round Innoscience — gallium nitride (GaN) power semiconductor company; SAIF Partners China's latest portfolio exit (December 2024) CB Insights. GaN chips enable more energy-efficient power conversion Solar & Renewable Energy Software: SenseHawk — an intelligent cloud-based platform for maximizing energy and infrastructure asset performance, with an initial focus on utility-scale solar. SAIF Partners invested \$2 million in its Series A round. The News Minute Carbon & Climate Tech: CarbonZeroX — SAIF Partners China's latest cleantech investment, a Seed round in October 2024 CB Insights Step 8: Other greentech startups Chinergy Capital EquityZenFinSMEs Chinergy Capital has essentially no other publicly identifiable portfolio companies beyond Amprius Technologies. Step 9: Find the overlaps: { MiaSolé, Mascoma }

Model Failure	Model A

CONFIDENTIAL ruban.arnold@gmail.com+outlier 2026-04-07T20:06:46.080Z	Identified the winner startup wrongly: Pila Energy. The entire answer was constructed wrongly after that. ZymoChem was the suggested solution for the query. Model B Identified correctly that Amprius Technology was the winner. Found MiaSolé but incorrectly included QuantumScape (solid-state batteries). It also missed Mascoma.
